

Supplementary Figure 1. Verification of the non-specific effect of COR solvent (DMSO) in I/R-induced AKI mice

In the I/R + DMSO group, the mice were injected intraperitoneally with an equal volume of normal saline containing the same final concentration of DMSO (0.1%) for 1 week, after which an I/R-induced AKI model was established. (A) Levels of serum creatinine (Scr) and blood urea nitrogen (BUN) in each group
